

# Predicting customer buying behavior

# RESULTS

## Evaluation

- The most important variable in the model was `purchase_lead`, that is the time between purchase and departure.
- Information about the flight, e.g. flight time and duration was also significant, however booking origin of the customer was not important.
- The accuracy of the model was approximately 0.84 (Precision) and 0.778 (Recall), showing that this model requires more improvement. I suggest adding more customer-centric features into the model.
